AUTOJOPPS · AUTOMATED JOB OPPORTUNITIES

Job applications on autopilot, with you in the loop

An AI agent that finds matching roles, tailors and submits applications within your limits, asks you only when a human is truly needed, keeps proof, and learns from you. Built India-first.

Working prototype v1 live · github.com/devashishb-rms/Auto-Jopps

Devashish Bhattacharjee, Founder · Prepared for Fundizr · 29 October 2026

The problem: applying for jobs is repetitive, opaque and exhausting

Hours of retyping

The same profile and screening answers go into every portal and ATS form. A serious search means 100-400 applications; each takes 10-25 minutes by hand.

Today's bots fail silently

Auto-apply tools stop at OTPs, CAPTCHAs and odd questions, break when a portal changes, and do not show what was sent. Senior candidates will not put their name on that.

Nothing built for India

USD pricing, no WhatsApp alerts, no Naukri-style profile, no view of what the recruiter did, no DPDP posture.

115M resumes on Naukri, about 21,000 added every day (Info Edge, Q4 FY26). **200M** LinkedIn members in India (Sept 2026).

The volume of applying is enormous; the tooling for the person applying has not kept up.

The solution: an agent that applies for you, pauses for you, and shows you everything

1

Set up once

Resume in, profile auto-filled, targets, 2-3 dream JDs, alerts, plan. About 5 minutes.

2

Applies within your caps

Finds and scores roles, tailors a note, fills forms, submits. 5 / 10 / 20 a day by plan.

3

Asks only when needed

OTP, human check, sign-in or an unusual question: a WhatsApp / email alert and a live view of the bot's own browser.

4

Proof and tracking

Reference id and screenshot for every submission; viewed, in process, shortlisted.

5

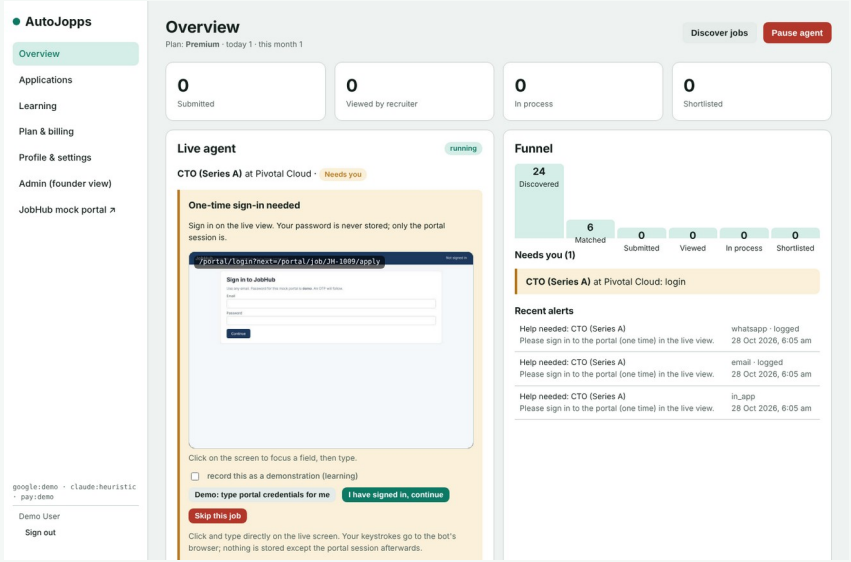

Learns from you

Answers remembered, portal skills versioned, self-heals when a page changes.

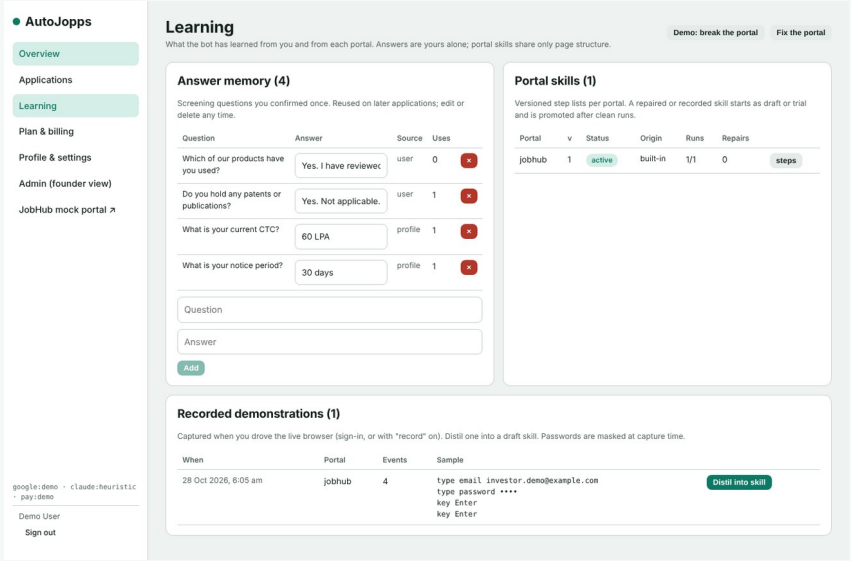

Human-in-the-loop is designed in, not bolted on: every pause resumes at the same step, and the final submit can wait for the user's approval.

The product today: a working prototype, tested end to end

Live view: the user signs in to the portal once in the bot's browser

Learning: answer memory, portal skills, recorded demonstrations

Implemented and exercised by automated tests: Google sign-in, resume parsing, 8-step onboarding, 3 plans with Razorpay checkout and caps, orchestrator, Playwright runner, 5 human-help states with live view, email / WhatsApp / in-app alerts, tracker with proof, answer memory, skill versions, self-heal, DPDP delete-my-data, admin cost meter. React + FastAPI + Playwright, ~2,400 lines, on GitHub.

How it works, and why it gets better with every application

The learning loop (our moat)

1. Observe: the user applies once in the live browser; the trace is recorded with consent.
2. Distil: the trace becomes a versioned portal skill with several ways to find each field.
3. Remember: screening answers are confirmed once and reused.
4. Replay: the runner applies the skill to new jobs.
5. Self-heal: when a page changes, the step is repaired and a trial version is filed; promoted after clean runs.
6. Canary: skills are replayed daily on test accounts.

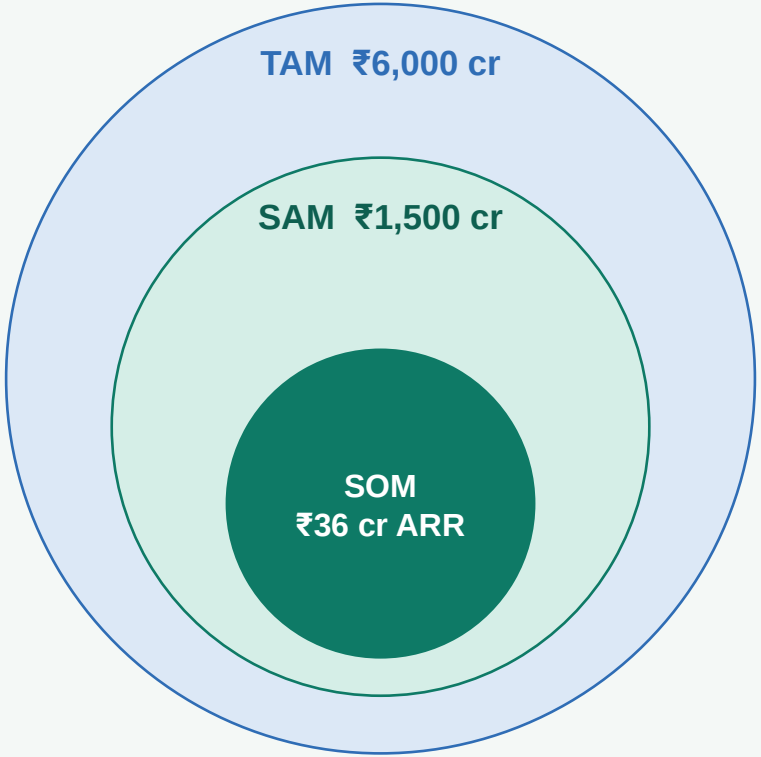

Verified in the prototype: 8 locators repaired automatically after the portal renamed its fields.

Why it is hard to copy

- A skill library that compounds with every user and every portal change.
- Human-in-the-loop as a first-class state, with a live view of the bot's own browser, not a screenshot after the fact.
- India-first plumbing: rupee plans, WhatsApp alerts, Naukri-style profile, DPDP consent and erasure built in.
- Cost discipline: cost per application is metered from day one, with a path from LLM-driven to scripted steps.
- Founder has built inside Naukri.com and LinkedIn, and shipped 8-10 B2B SaaS products.

Market: a large, under-served candidate-side market in India

TAM: ₹6,000 cr / yr (~$630M)

India's active online job seekers, est. 20M a year (Naukri holds 115M resumes and adds 21k a day; EPFO added 14M formal subscribers in FY25) × ₹3,000 a year (3 months of Premium).

SAM: ₹1,500 cr / yr (~$160M)

Experienced knowledge workers (3+ years) actively searching on Naukri / LinkedIn with intent to pay, est. 5M a year × ₹3,000. Naukri reports paid users at 2.2% of monthly actives, so paying intent exists on the candidate side.

SOM (year 3): ₹36 cr ARR (~$3.8M)

40,000 paying users (0.8% of the 5M seekers in SAM) at an average ₹750 a month across the three plans, through Naukri-adjacent channels, placement cells, bootcamps and referrals.

Estimates at ₹95 / USD. Context: global online job advertising is $37.6B in 2026 (SIA), all of it employer-side spend.

Business model: three monthly plans, margin that grows as steps get scripted

Plan	Price / month	Daily cap	Monthly cap	Net revenue	Net per application
Basic	₹501	5	100	₹416	₹4.16
Premium	₹1,001	10	200	₹831	₹4.16
Ultra	₹2,001	20	400	₹1,662	₹4.16

Contribution margin per user (after cloud, model, messaging, support)

What the numbers say

- Every tier nets about ₹4.16 per application, so the all-in cost per application must stay under ₹2.
- Cloud alone breaks even at about 140 users; a ₹5 L / month team at about 1,100-1,400 users.
- Rung 1 (LLM driving a GUI bot) loses money on every tier; that is why scripted adapters and the learning loop come first.
- Also to test: outcome-linked fee on offers; licences for placement cells and coaches.

Competition: opaque auto-apply tools priced in dollars

Tool	Price	Human-in-the-loop	Learns the user	Proof of submit	India fit
LazyApply	$99-249 one-time	No	No	Weak	No
Sonara	~$49 / month	No	Partial	Weak	No
AIApply	~$29 / month	No	Partial	Partial	No
Jobright	Free; $30 / month	Partial (assist)	Partial	Partial	No
Simplify	Free; $30 / month	Browser extension	Partial	Partial	No
AutoJopps	₹501-2,001 / month	Live view + 5 pause states	Answer memory + skills + self-heal	Reference + screenshot	Rupee, WhatsApp, Naukri model, DPDP

Independent reviews report that many tools do not autonomously submit at all, and users cannot see what was sent. LinkedIn's user agreement prohibits bots; AutoJopps keeps LinkedIn automation off by default and applies where terms allow.

Go-to-market: start where trust is highest, then scale through partners

1. Founder-led beta (now)

25 senior tech professionals from the founder's network in Delhi NCR and Bengaluru. Goal: 90%+ verified submit rate, first paid conversions, cost per application measured.

2. Content and referral (month 2-4)

LinkedIn posts with real, anonymised proof of applications; a "watch me apply" live-view demo; referral month free. WhatsApp as the service channel.

3. Partner licences (month 4-12)

Placement cells, bootcamps, career coaches and outplacement firms buy seats for continuous candidate flow, which also answers churn after a successful search.

Pricing experiments in beta: GST-inclusive vs exclusive; a short, higher-priced sprint for active seekers; re-activation offers for the next search. **Channel costs:** target blended CAC under one month of Premium (₹1,001) by month 6.

Traction and roadmap

Done (Oct 2026)

Working bot on Grok Bot; Prototype v1 of the SaaS: full journey, live view, caps, tracking, learning loop; automated E2E tests; PRD, architecture, cost model

Next 6 weeks

Naukri + one ATS family as real adapters; Postgres, encrypted vault; Razorpay Subscriptions; 25-user private beta; cost per application measured

By week 12

Public launch; cells and autoscaling; canary bot; WhatsApp templates approved; DPDP notice and runbooks; security review

12 months

5+ portals and career sites; teacher agent for new portals; partner licences; 5,000 paying users; cost per application ≤ ₹1.2

KPIs we will report monthly: verified submit rate, human-help events per application, cost per application, activation, paid conversion, reply rate (viewed or in process / submitted), churn.

Team

Devashish Bhattacharjee, Founder and CTO

18+ years building and leading engineering. B.Tech and M.Tech in Computer Science, IIT Delhi; executive programmes at IIM Bangalore and INSEAD.

• Built inside the job market: Naukri.com and LinkedIn.
• Platforms at scale: Microsoft, Flipkart, IBM; AVP Solution Architecture at GeM (national e-procurement), where he architected fraud and collusion detection.
• Has shipped 8-10 B2B SaaS products; deep in browser automation and GenAI tooling.
• Built the working AutoJopps bot and Prototype v1.

First hires (with this round)

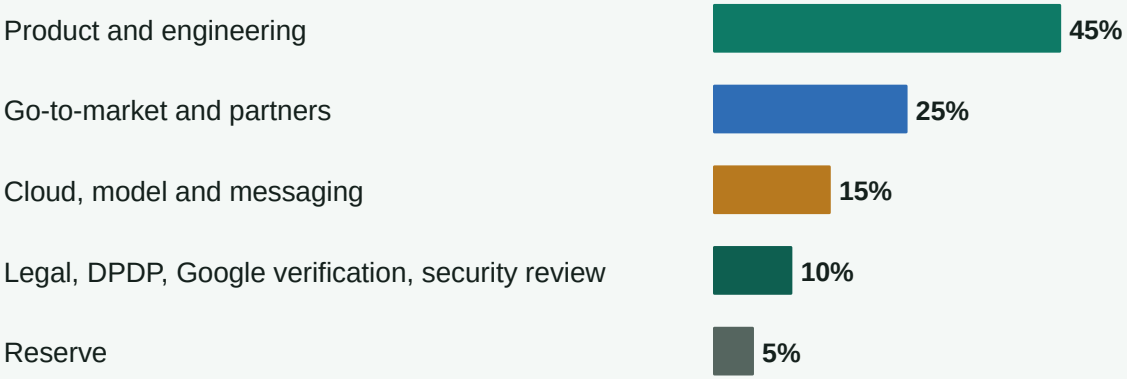

• Automation engineer: portal adapters, skills, canaries.
• Full-stack engineer: product, billing, live view.
• Growth lead (part-time at first): beta, content, partners.

Advisors sought: HR-tech operator; data-protection counsel.

The ask (proposal for discussion with Fundizr)

₹1.5-2 cr pre-seed for 12-15 months of runway

Milestones this funds: public launch on 2 real portals within 12 weeks; 5+ portals and 5,000 paying users within 12 months (about ₹40 L gross MRR at a 60/30/10 plan mix); cost per application ≤ ₹1.2; monthly KPI reporting to investors.

Risks, assumptions and dependencies

Risk or assumption	Mitigation
Portal terms and bot blocking (LinkedIn prohibits bots; others may rate-limit)	Apply only where terms allow; LinkedIn off by default; human sign-in with stored session; per-user pacing within caps; adapters per portal
Cost per application above ₹2 if steps stay LLM-driven	Scripted adapters first; learning loop moves steps from model to script; per-tenant cost meter and kill switch
Google Gmail verification (restricted scope, CASA) takes months	Forwarding-alias route works today; verification pursued in parallel
Successful users churn after one search	Short sprint pricing, re-activation offers, partner licences with continuous candidate flow
DPDP obligations and user trust	Consent with timestamp, erasure built in, processor register, breach runbook before launch, counsel engaged
Single founder today	Round funds two engineers and a growth lead; prototype and documents de-risk the build

AutoJopps

Job applications on autopilot, with you in the loop.

Demo on request: the live agent applying on the built-in portal, pausing for OTP and a human check, and healing itself after a page change.
