Architecture addendum · 28 October 2026

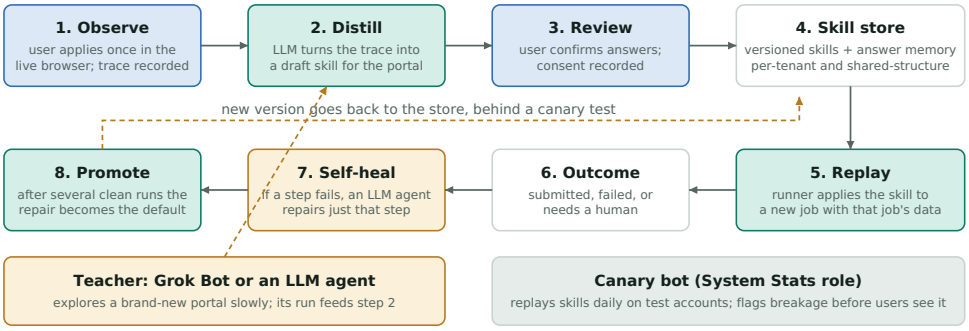
The learning loop: how AutoJopps learns to apply

How the system learns from watching you apply, reuses it on other jobs, and keeps getting cheaper. Added to the AutoJopps architecture.

In short

- The loop is observe, distill, review, store, replay, self-heal, promote. It is code we write; it is not free.
- It adds about 10 person-weeks (my estimate): the launch moves to about 4.5 months and ₹50-60 lakh for a 5-person team.
- Grok Bot stays as the **teacher** on new portals. What it learns is compiled into fast scripts.
- Not checked: how Grok Bot stores what it learns, and whether it can export it.

1. The loop



Eight steps. Amber arrows are the repair path.

2. What gets stored

Item	What it holds	Who can see it
Recording	Clicks, fields, page structure and network calls from one demonstration. Deleted after distilling (suggest 30 days).	That user only
Skill	Steps for one portal, several ways to find each element, field-to-profile mapping, success rate, version, status: draft, trial, active, retired.	Page structure shared across users; no personal data
Answer memory	Screening questions and the user's confirmed answers, searched by meaning, with source and date.	That user only
Run log	Every replay: steps taken, repairs, outcome, cost.	Tenant and operator (anonymised for tuning)

3. Rules that keep it safe

- A new or repaired skill is not used for real submissions until it passes a trial of several clean runs.
- An unseen screening question pauses for the user. The system never guesses a legal, salary or consent answer.
- Every skill version can be rolled back in one step.
- Personal answers never cross tenants; only page structure is shared.
- The user gives explicit consent before a recording starts and can delete recordings and answers at any time (DPDP).
- The final submit step stays behind the user's approval setting.

4. Build plan and effort

Phase	What ships	Person-weeks	What the user sees
A	Recorder in the live view; answer memory with confirm-once	4	Answers asked once, reused for every later job
B	Distiller and replay for 2 portals	4	Watch me apply once; the bot repeats it on new jobs
C	Self-heal, trial and promotion, canary checks	2	Fewer breakages; cost per application falls

Total about 10 person-weeks (my estimate, to be refined once we know what Grok Bot can export). Success measures: replay success

rate, share of steps needing the LLM, cost per application, and applications per user without help.

5. Questions to settle

1. Can Grok Bot export its learned skills, or only run them?
2. Does it learn the portal's page structure, the user's answers, or both?
3. Are its terms fine with our compiling what it learns into our own scripts?

Estimates, not quotes. Prepared 28 October 2026.
